The patient

A 48-year-old man presented with a two-year-history of a slowly growing pigmented lesion on his forehead. Dermatological examination revealed an irregular, multi-colored papule with a diameter of 25 x 26 mm (Figure 1). Dermatoscopic examination disclosed blue-gray globules, leaf-like structures and structureless areas (Figures 2, 3).
What is your diagnosis?

Please send your answer to dpc@derm101.com. The first correct answer will receive a DL3N hand dermoscope [cordially sponsored by 3GEN]. The case and the answer to the question will be presented in the next issue of Dermatology Practical & Conceptual.
